Einladung zum Kolloquium

Ort: Universität zu Köln
II. Physikalisches Institut, Seminarraum 201

Sprecher: Dr. Martine Hennion
Laboratoire Léon Brillouin CE-Saclay,
(91190) Gif-sur-Yvette, France

Thema: The peculiar magnetic state of low-doped
La$_{1-x}$(Sr,Ca)$_x$MnO$_3$ manganites

The phase diagram of hole-doped manganites exhibits a variety of spectacular properties like Colossal Magnetoresistance, charge ordering, orbital ordering etc. The microscopic nature of these systems as well as the mechanism which gives rise to such properties are still much debated. We will review the observations by inelastic neutron scattering in La$_{1-x}$B$_x$MnO$_3$ (B=Ca, Sr), in the canted state and in the doping range just before the occurrence of the true metallic state ($x_{Ca}<0.22$ and $x_{Sr}<0.17$) where a ferromagnetic and quasi-metallic state occurs. In this range, illustrated by the three compounds La$_{83}$Ca$_{17}$MnO$_3$, La$_8$Ca$_2$MnO$_3$ and La$_{7/8}$Sr$_{1/8}$MnO$_3$ very peculiar magnetic excitations are observed, analysed in terms of confined spin waves into nanosize domains.

Gez. Prof. M. Braden
