SFB 608

Einladung zum Kolloquium

Ort: Universität zu Köln
     II. Physikalisches Institut, Seminarraum 201

Zeit: Mittwoch, den 18.02.04, 15 Uhr c.t.

Sprecher: Dr. M. Pothoff
           Institut für Theoretische Physik und Astrophysik
           Universität Würzburg

Thema: Cluster approaches to correlated electrons in one and two dimensions

Based on a new variational principle, an extension of the cluster-perturbation theory is presented which applies to systems with spontaneously broken symmetry. The method accounts for both short-range correlations and long-range order: Short-range correlations are accurately taken into account via exact diagonalization of finite clusters. Long-range order is described by variational optimization of a fictitious symmetry-breaking field. In comparison with related cluster methods (cluster-DMFT), the approach is more flexible and, for a given cluster size, less demanding numerically, especially at zero temperature. An application of the method to the antiferromagnetic phase of the Hubbard model at half-filling shows good agreement with results from quantum Monte-Carlo calculations. It is demonstrated that the variational extension of the cluster-perturbation theory is crucial to reproduce salient features of the single-particle spectrum.
